

INSPIRING A VIBRANT COMMUNITY OF NURSING

PHOENIXVILLE HOSPITAL NURSING QUALITY OUTCOMES 2018

Phoenixville Hospital has been benchmarking nursing quality outcomes with the National Database of Nursing Quality Indicators (NDNQI) since the 4th quarter of 2016 and has 7 quarters of data reported. Unit and hospital level data was submitted for injury fall rate, hospital acquired pressure injury (HAPI) prevalence, and catheter associated urinary tract infection (CAUTI) and central line associated bloodstream infection (CLABSI) rates to compare with like units from more than 1,500 hospitals participating in the NDNQI database. Nurse education and certification rate is also being benchmarked.

ZERO CLABSI FOR 7 CONSECUTIVE QUARTERS!

Nursing collaboration with the interprofessional team to assure best practice for our patients has resulted in ZERO central line associated blood stream infections.

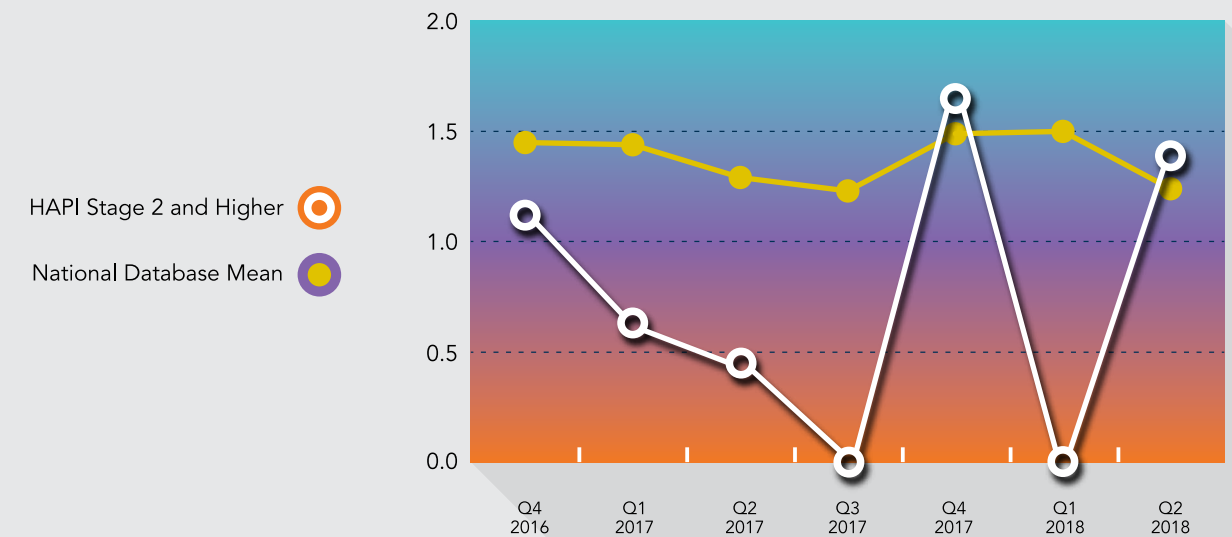

ZERO CAUTI FOR 7 CONSECUTIVE QUARTERS!

Reducing hospital acquired infections such as CAUTI keeps patients safe while in our care and reflects the highest quality of nursing care.

LOWER PRESSURE INJURY PREVALENCE THAN NATIONAL BENCHMARKS

As a result of nursing best practice for HAPI prevention, HAPI prevalence rate outperformed the NDNQI mean benchmark for 5 of 7 quarters.

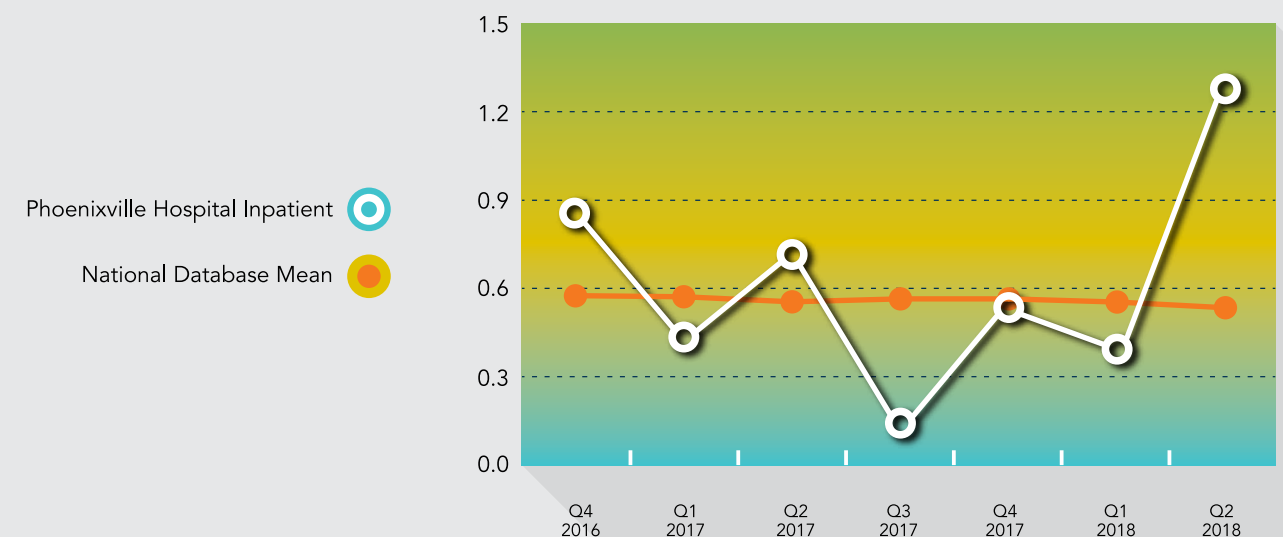

Hospital Acquired Pressure Injury Stage 2 and Higher

FOCUS ON REDUCING INJURY FALL RATE

4 of 7 quarters Phoenixville Hospital injury fall rate was lower than the NDNQI mean benchmark. Reducing falls and injury falls remains the priority quality focus.
